Education participation in Afghanistan

MICS 2022–23 | Attendance during school year 1401 | Ages 7–17 at interview

Children in survey sample

Sample Children
61796

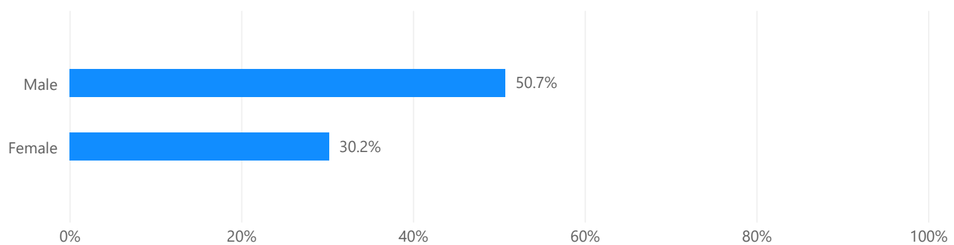

Weighted attendance - known answers

Weighted Attendance %
40.58%

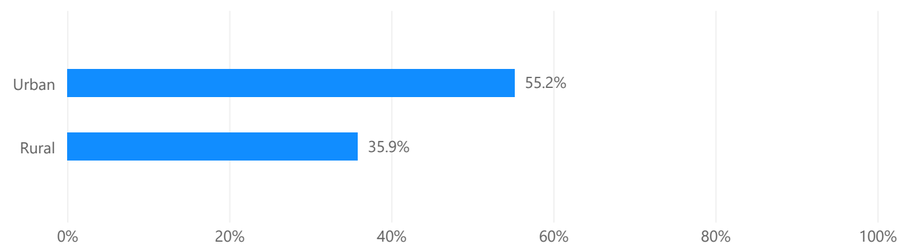

Residence

- [ ] Rural
- [ ] Urban

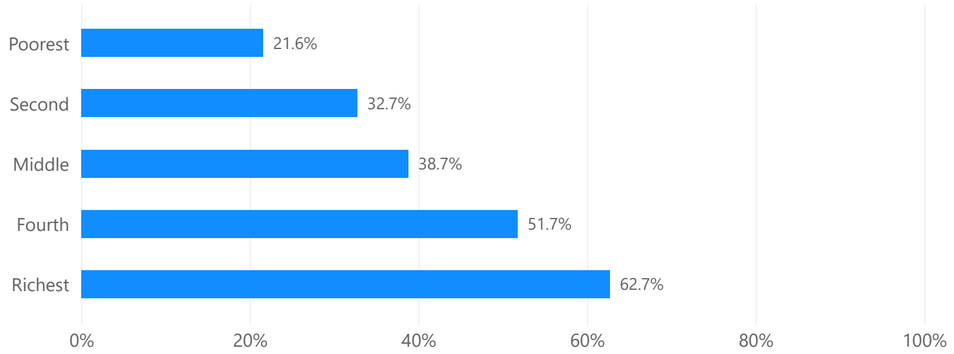

Attendance by sex -- school year 1401

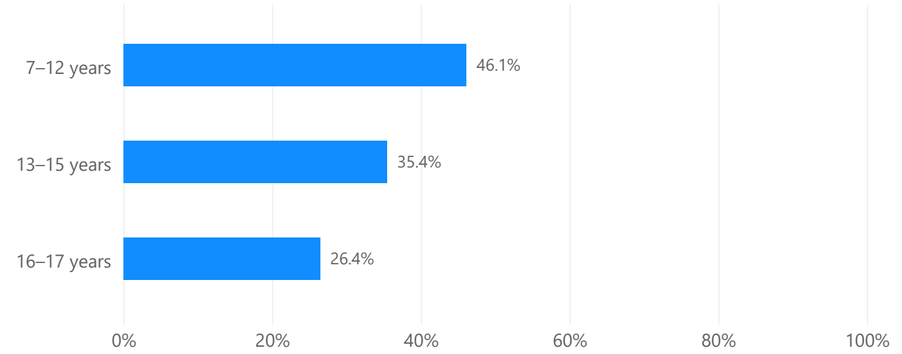

Attendance by residence -- school year 1401

Attendance by household wealth -- school year 1401

Attendance by age at interview -- school year 1401

Percentages use household survey weights and exclude unknown/no-response attendance. Attendance includes formal Islamic education and early childhood education.

Source and scope
UNICEF Afghanistan MICS 2022–23. This analysis uses household and household-member records from completed household interviews. It includes 61,796 children aged 7–17 at interview.

Attendance definition
Attendance at any time during school year 1401, including school, formal Islamic education, and early childhood education. Children recorded as never having attended education, with the attendance question skipped, are classified as not attending.

Calculation
Weighted attendance = sum of household weights for children attending ÷ sum of household weights for children with known attendance.

Missing answers
61,763 children have known attendance status. The remaining 33—27 Unknown and 6 No response—are excluded from the attendance percentage and retained in sample counts.

Interpretation limits
Age groups use age at interview. These are descriptive attendance estimates, rather than official school-level net attendance rates. Comparisons do not establish causes or track individual dropout. Confidence intervals and statistical significance have not been calculated.

Education participation: key findings.

Overall survey results with all filters cleared.

- **Residence:** Urban attendance was **55.21%**, compared with **35.86%** in rural areas—a **19.35 percentage-point gap**.
- **Sex:** Male attendance was **50.75%**, compared with **30.23%** for females—a **20.52 percentage-point gap**.
- **Household wealth:** Attendance increased across wealth groups, from **21.55%** among the poorest to **62.66%** among the richest—a **41.11 percentage-point gap**.
- **Age and sex:** Female attendance was **39.73%** at ages 7–12, **19.68%** at ages 13–15, and **10.68%** at ages 16–17. This identifies older females as a group requiring closer investigation.

All percentages are weighted and exclude unresolved attendance answers. Findings describe associations; they do not establish causes.
